

Cheyenne Creek, Colorado Springs, Colorado

(Section 205):

The study is located along Cheyenne Creek in Colorado Springs, Colorado. The purpose of the study is to determine Federal interest and provide flood damage reduction within the drainage area of Cheyenne Creek, by developing a cost-effective solution.

The area has been impacted by frequent flooding. There are over 600 structures in the 100-year flood plain. This study is being recommended for inclusion in the Fountain Creek and Tributaries General Investigation study, since estimated project construction costs exceed Continuing Authorities Program authorities.
